

ABSTRACT OF THE DISCLOSURE

A user presets in a PC information, such as the user's favorite program categories, artist names, as key information. A receiver receives a digital radio broadcast in which additional information is multiplexed with audio information. The received additional information is transferred to the PC via communications means. The PC determines whether the preset key information is included in the additional information. If the key information is included, the additional information is stored in a storage device as an additional information file. Alternatively, the additional information is transmitted on a communications network with an ID of an information processing terminal at a user-specified destination attached thereto. The arrangement may be such that when a connection is established between the receiver and the PC via the communications means, the key information is transmitted from the PC to the receiver so that additional information can be selected on the receiver.
